AES topic profiles

Settings

parameter	value	meaning
alpha	0.1	FDR threshold. A topic part is kept only if its q value is below this.
min_used	5	Use part: at least this many essays (both levels together) must use the topic before it is tested.
min_acc_users	3	Accuracy part: at least this many essays in each level must use the topic before accuracy is compared.
min_class	8	A boundary is modelled only if both levels have at least this many essays.
seed	42	Random seed for the internal cross-validation that chooses the regularisation strength.

Cross-validation: 5 folds × 3 repeats. A kept feature is *stable* if it is kept in at least 80% of folds and its coefficient has the same sign in at least 90% of them.

What separates the levels

Every topic part that the model uses at each boundary. Read down a column to see what separates two adjacent levels; read along a row to see where one topic matters.

Boundaries

Each pair of adjacent levels is analysed separately, using only essays from those two levels. Every topic has two parts: **use** (how often the topic is used) and **accuracy** (correct uses / all uses, only among essays that use it). A part is kept if it differs reliably between the two levels; AUC above 0.5 means the value is higher in the upper level. The highlighted table lists the kept parts, strongest first, with their typical value in each level.

> **No topic reliably separates C1 from C2.**

▸ Dropped: no reliable difference between the two levels (138)

▸ Dropped: too little data to test (39)

Accuracy within each level

Each essay's accuracy is its correct topic uses divided by all its topic uses. The bands show how accuracy is spread within a level, in steps of 10% of the essays; the red line shows how the mean changes from level to level.

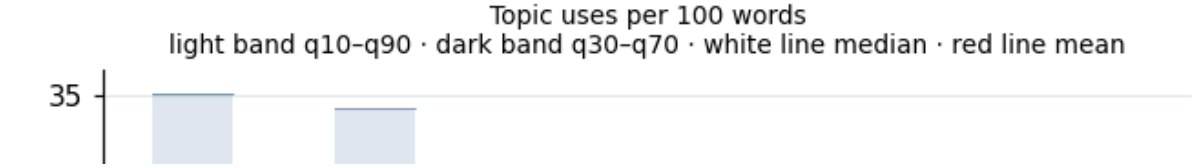

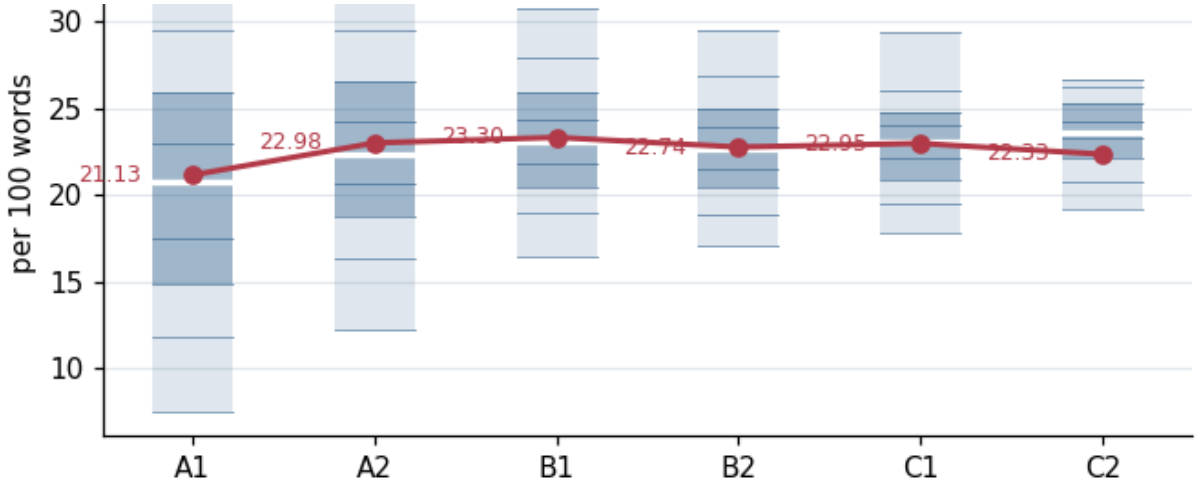

level	n	10%	20%	30%	40%	50%	60%	70%	80%	90%	mean
